Nome: MARIA ANTONIA

Cognome: CAVUOTO

Firma: Maria Antonia Cavuoto

PROVA ORALE N. 1

1. Nell'ipotesi di dover caratterizzare un sito ex industriale il candidato descriva quali sono le principali tecniche di indagine per acquisire dati ambientali sul suolo insaturo e sulla componente aeriforme del suolo insaturo.

PROVA DI INGLESE

Children are often more heavily exposed to toxins in the environment than adults because pound for pound, children breathe more air, drink more water, and eat more food than adults. Children's behaviour patterns, such as playing close to the ground, increase their exposure to potential toxics.

In addition, children may be more vulnerable to environmental hazards because their systems are still developing, which often makes them less able to metabolize, detoxify, and excrete toxins. Environmental risks to children include asthma-exacerbating air pollution, lead-based paint in older homes, treatment-resistant microbes in drinking water, and persistent chemicals that may cause cancer or induce reproductive or developmental harm.

PROVA ORALE N. 2

1. Il candidato descriva una tecnologia di bonifica specifica per i terreni insaturi.

PROVA DI INGLESE

Site-remediation is the process of removing polluted or contaminated soil, sediment, surface water, or groundwater, to reduce the impact on people or the environment. A polluted site can have a serious impact on human health, water supplies, eco-systems and even on building structures, which is why there are various safeguards now in place to deal with contamination issues.

Remediation is a fundamental consideration with the redevelopment of derelict brownfield sites where, the change of land use from industrial to residential will require assessment of contamination and validated site clean up.

PROVA DI INFORMATICA

Quali sono le specificità di un foglio di calcolo (es. Excel).

PROVA ORALE N. 3

1. Nell'ipotesi di dover caratterizzare un sito ex industriale il candidato descriva quali sono le principali tecniche di indagine per acquisire dati ambientali sul suolo insaturo e sulla falda.

PROVA DI INGLESE

The first step in assessing whether there is potential for significant contamination at a site is a Phase 1 Environmental Site Assessment. An assessment of the current site is undertaken along with a review of its previous history and neighbouring areas with potential contaminative activities. This provides the basis for an initial Conceptual Site Model, which will determine the extent of intrusive investigation required and the range of contaminants that we will test for.
