PROVA INGLESE - TURNO MATTINA

Every increase in global warming matters

The emissions that cause climate change come from every part of the world and affect everyone, but some countries produce much more than others. The seven biggest emitters alone (China, the United States of America, India, the European Union, Indonesia, the Russian Federation, and Brazil) accounted for about half of all global greenhouse gas emissions in 2020. Everyone must take climate action, but people and countries creating more of the problem have a greater responsibility to act first.

Three handwritten signatures are present at the bottom of the page. From left to right: a signature that appears to start with 'K' or 'P'; a signature that appears to start with 'M' or 'D'; and a signature that appears to start with 'A' or 'R'. These signatures are written in black ink on white paper.

PROVA INGLESE ~ TURNO Pomeriggio

People are experiencing climate change in diverse ways

Climate change can affect our health, ability to grow food, housing, safety and work. Some of us are already more vulnerable to climate impacts, such as people living in small island nations and other developing countries. Conditions like sea-level rise and saltwater intrusion have advanced to the point where whole communities have had to relocate, and protracted droughts are putting people at risk of famine. In the future, the number of people displaced by weather-related events is expected to rise.
